## **Ride sharing service**

I did this project by using java, Spring Boot, JPA, MySQL. I implemented 4 microservices. Each Microserver can do some operation. I describe the operation in below step by stepThe

Following four microservices I implemented here.

- 1      Admin
- 2      Driver
- 3      Passenger
- 4      Trip

1.Admin microservice can do these operations

- Admin can see all Users list
- Admin can search User by ID.
- Admin can Search Users by User Type (example: Admin, Passenger, Driver).
- Admin can Delete Users.

2. Driver microservice can do these operations

- Driver can check Active Trip
- Driver can take a Trip
- Driver can end Trip

3. Passenger microservice can do these operations

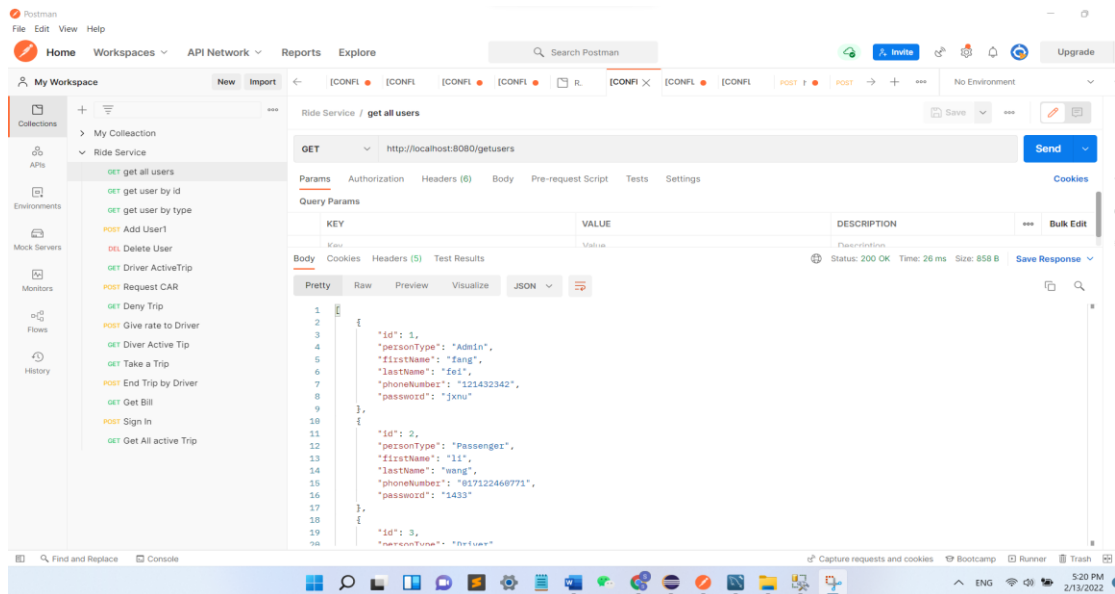

- Passenger can request for Car
- Passenger can Deny Trip
- Passengers can check active trips.
- Passengers can give rates to the driver.

4. Trip microservice can do these operations

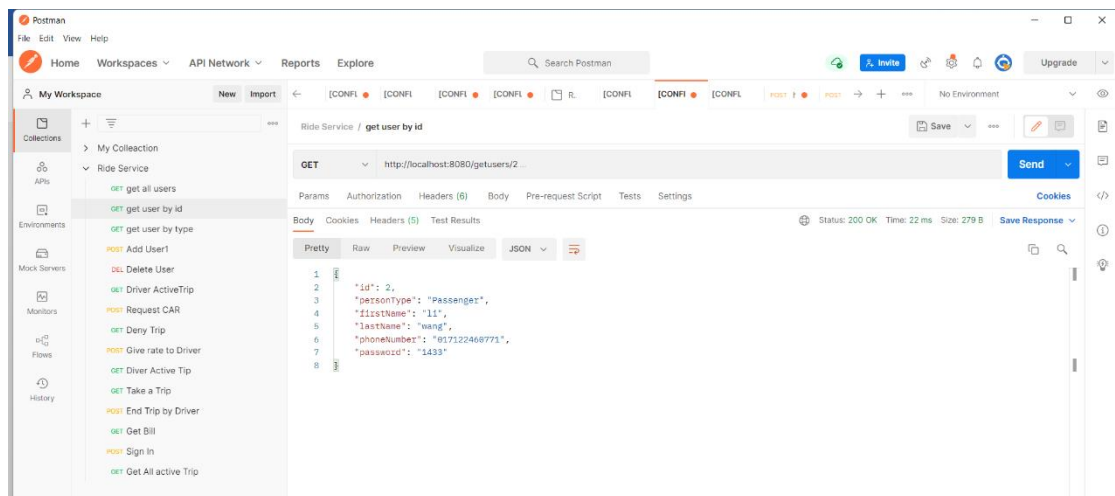

- Trip controller can make trip Bill
- Trip controller can check all the active trip
- Trip controller can give permission to user login.

## Admin microservice

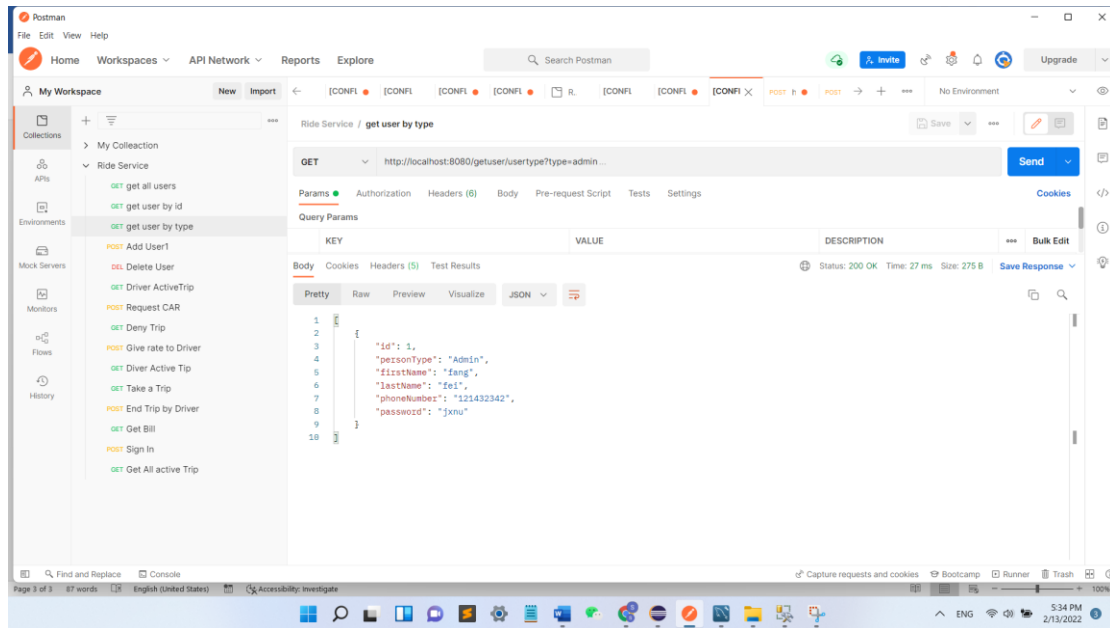

a) By the GET Method (<http://localhost:8080/getusers>) Admin can see All the the users

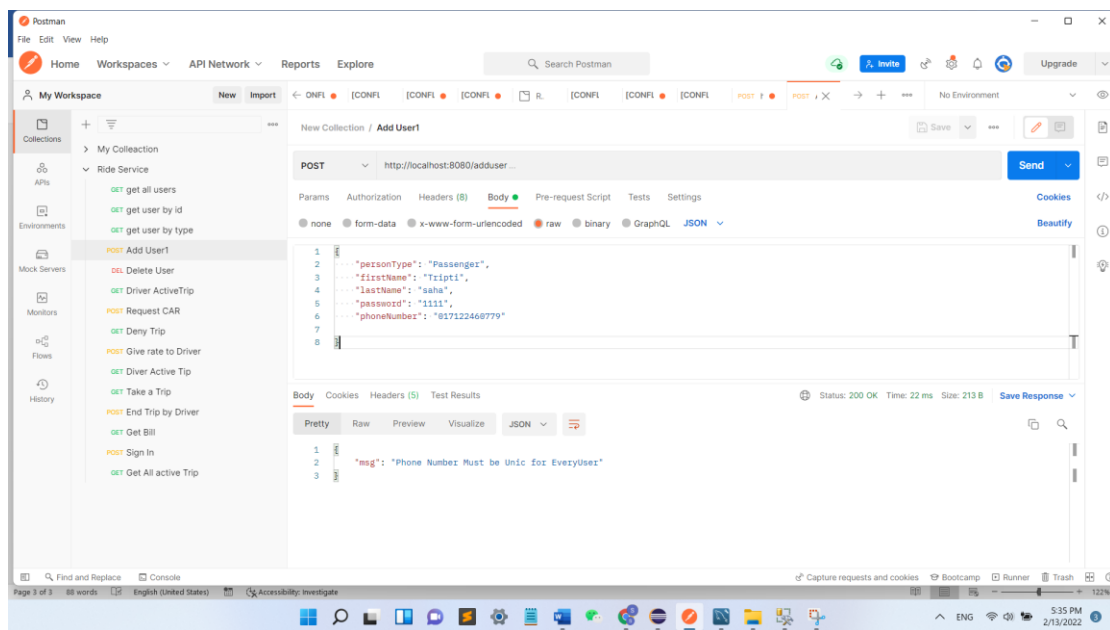

b) By the GET Method (<http://localhost:8080/getusers/2>) Admin can search users by ID.

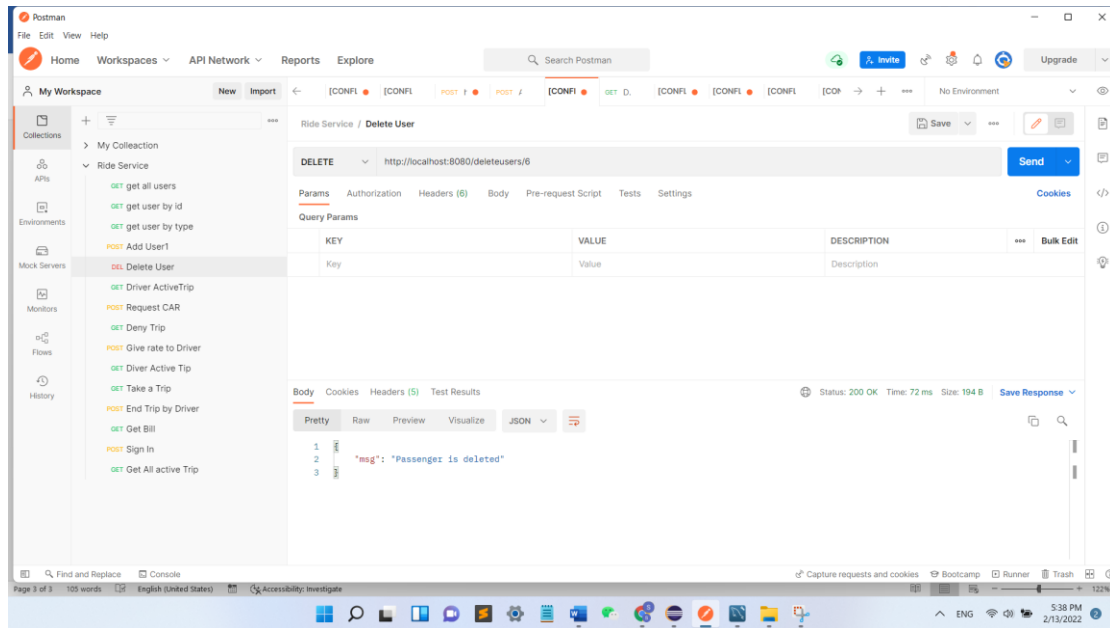

C) By the GET Method (<http://localhost:8080/getusers/usertype?type=Admin>) Admin can search users by Users Type.

d) By the POST Method (<http://localhost:8080/adduser>) Admin can add user by giving all the information request body.

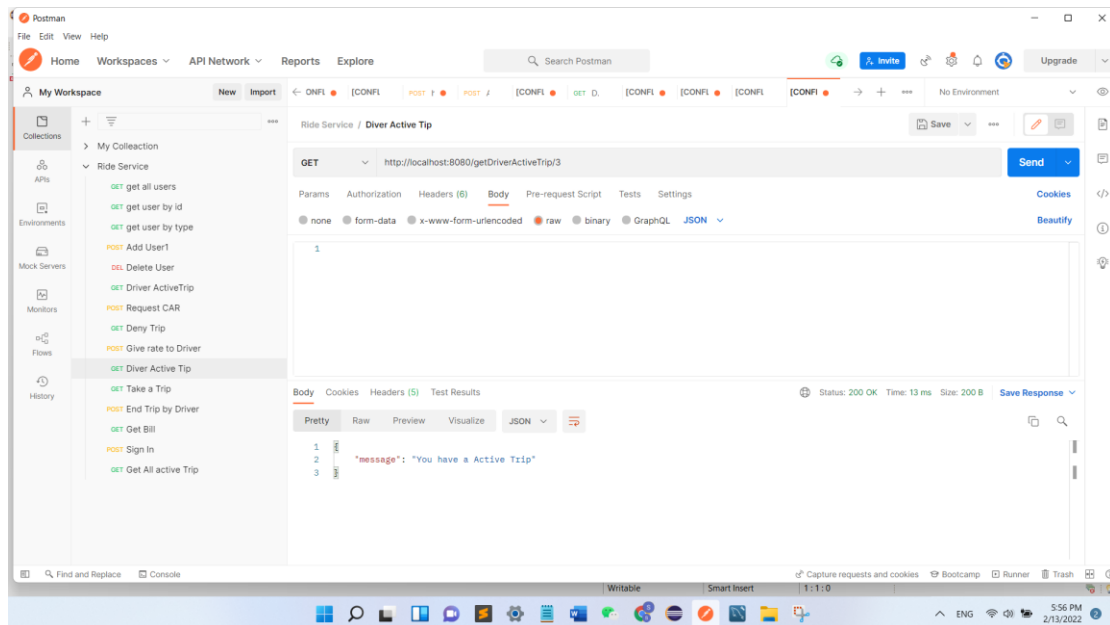

e) By the Delete Method (<http://localhost:8080/deleteusers/6> (Id number)) Admin can delete users by the ID number.

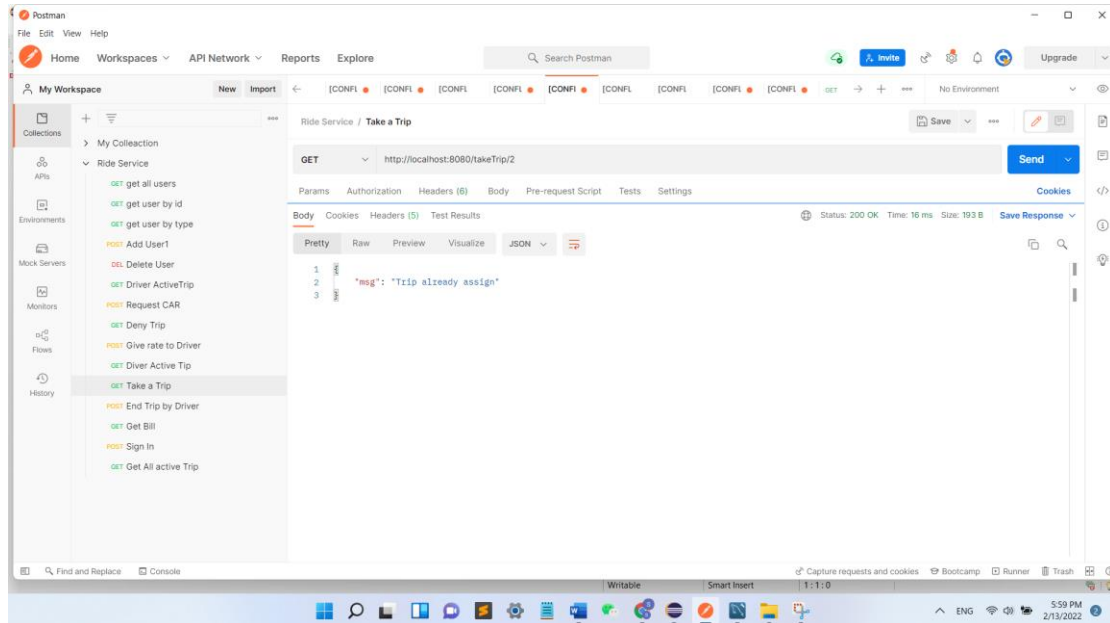

## Driver microservice

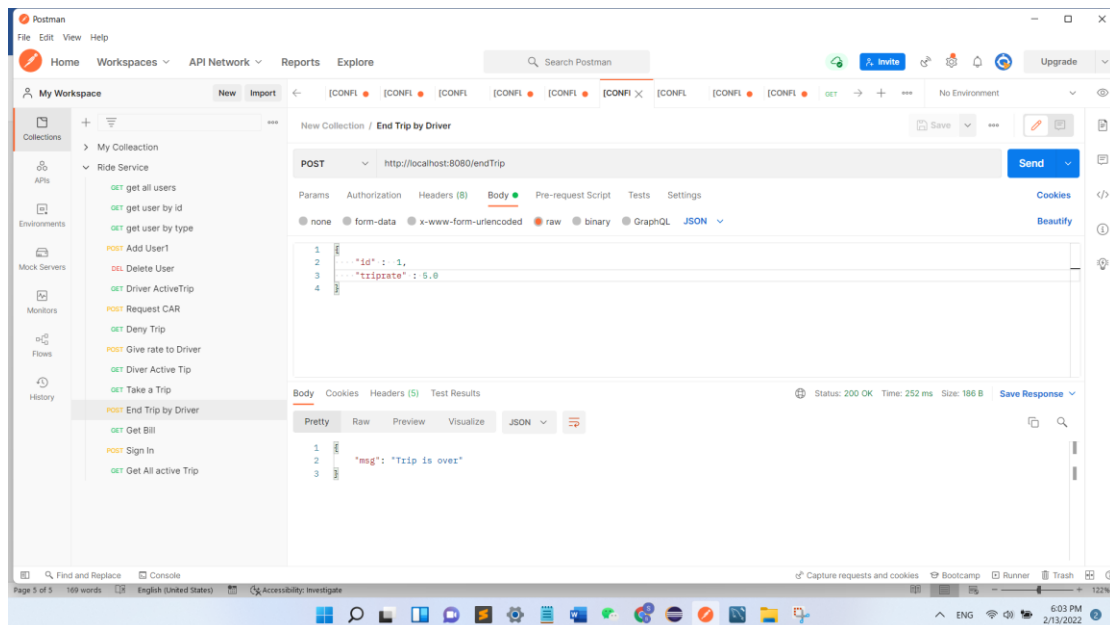

Driver: By using GET method (<http://localhost:8080/getActiveTrip/1>) driver can see active trip by using driver id.

Take Trip: By using GET Method( <http://localhost:8080/TakeTrip/2>) (Driver id) Driver can take a trip by using Trip ID.

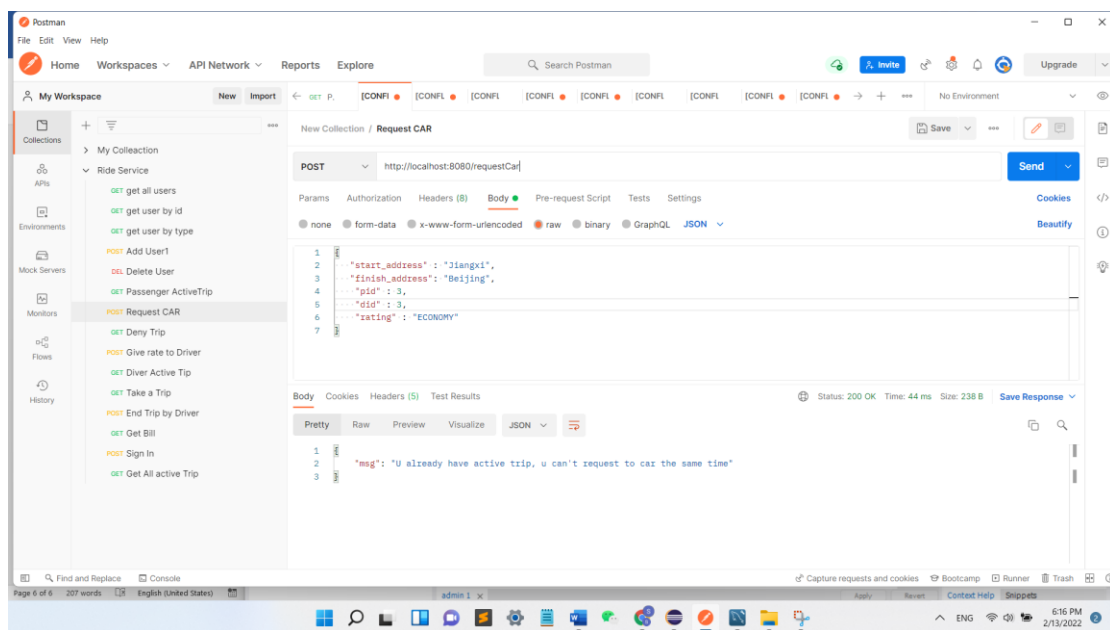

End Trip: Driver can end trip in by giving the trip id and trip rate in Request body.

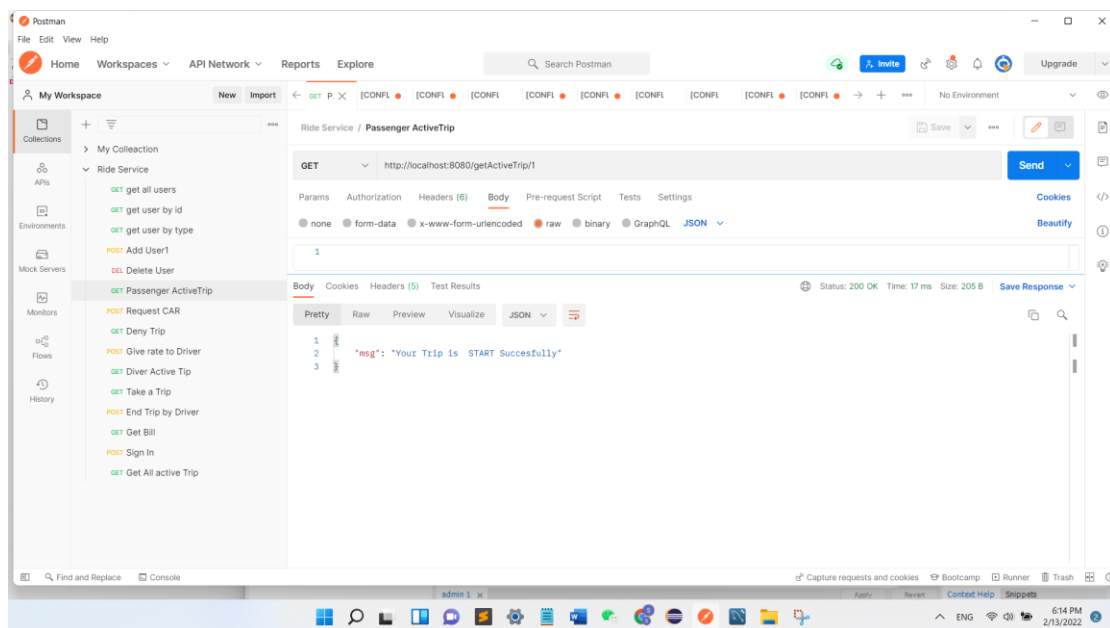

## Passenger microservice

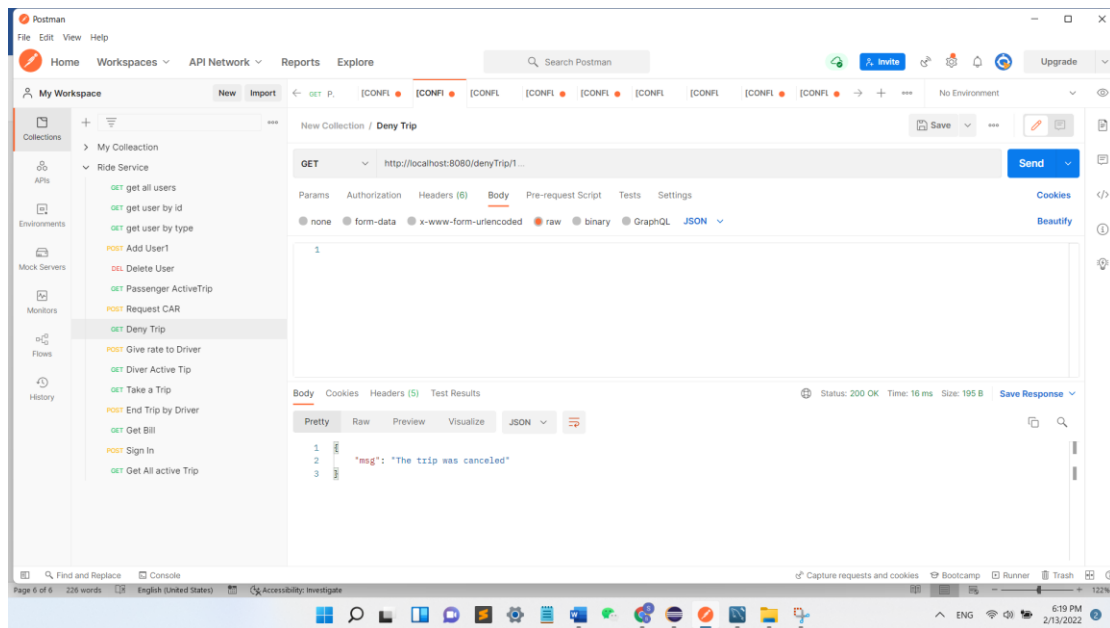

Request for Car: Passenger can Request for car by giving data in request body with POST method <http://localhost:8080/requestCar>

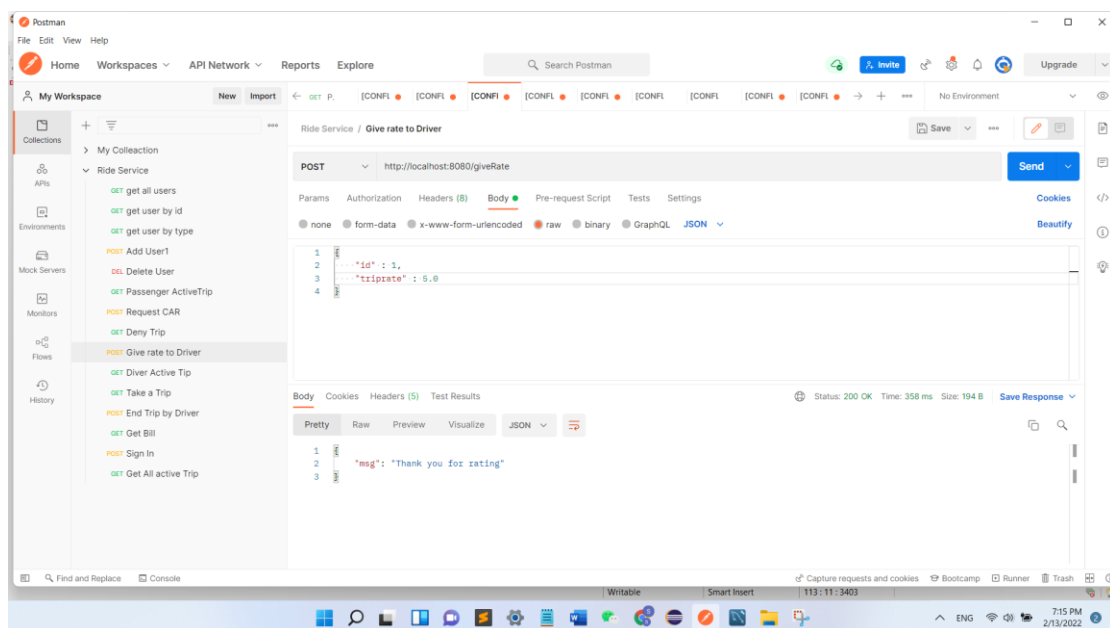

Passenger Active Trip: Using Get Method (<http://localhost:8080/getActiveTrip/1>) Passenger can found Active trip by giving passenger ID .

Deny Trip: Passenger can deny Trip by giving his ID <http://localhost:8080/denyTrip/1>

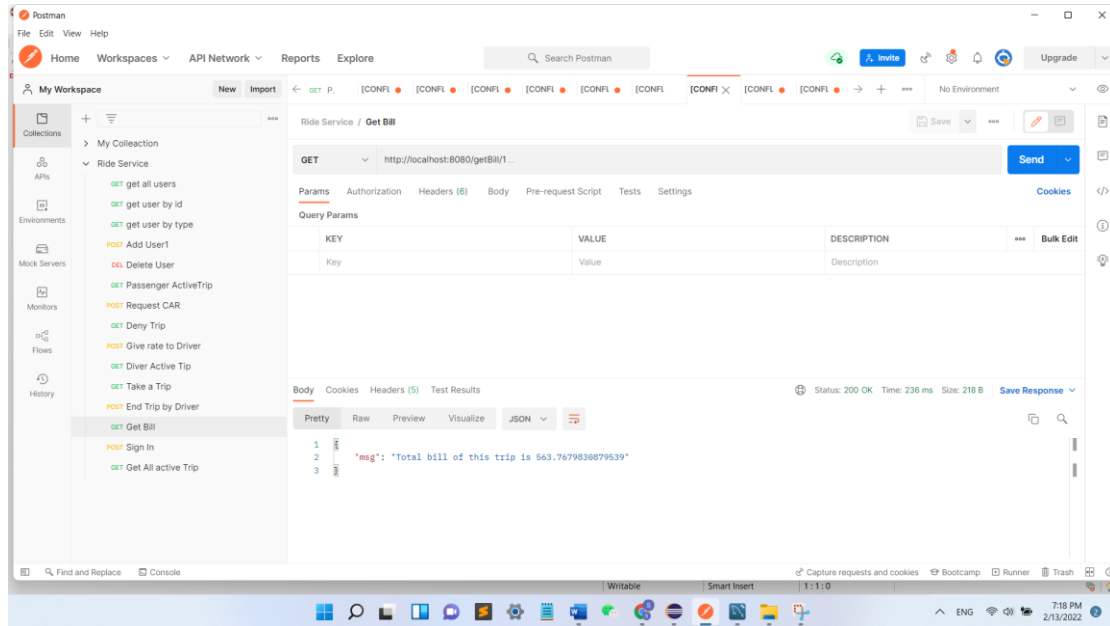

Give Rate to the Driver: Passenger can give rate to the driver

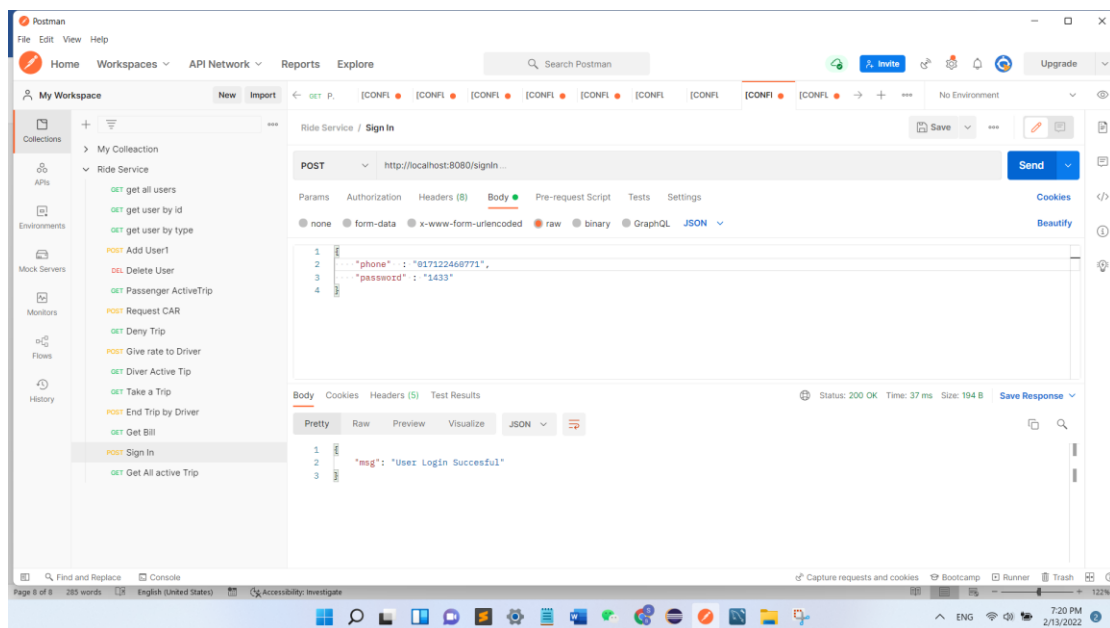

## Trip microservice

Billing: Trip Controller will show the trip bill by using the trip ID.

Login: Trip controller give permission user to login in the system.

Trip controller can check all the active trip.
